TERMIFILM*

TERMITE EXCLUSION SYSTEM

ACTIVE CONSTITUENT: 10 g/kg PERMETHRIN 25:75

GROUP 3A INSECTICIDE

For the protection of buildings and structures
from subterranean termites.

IMPORTANT: READ THE ENCLOSED LEAFLET BEFORE USE.

Contents:

1 Roll 100 metre x 200 millimetre x 0.2 millimetre (20m²)

THE BUGSHOP
ACN 113013693
3/10 QUINDUS STREET
BEENLEIGH QLD 4207

CUSTOMER SERVICE: 1800 814 199
EMERGENCY RESPONSE (ALL HOURS): 1800 814 199

STORAGE AND DISPOSAL:

Store in the original packaging in a cool well-ventilated area. Dispose of unused off-cuts by laying over the Termifilm barrier at an installation site and cover with concrete slab or place in cavity wall. If this is not possible, off-cuts should be placed in a sealed plastic bag and disposed of via an approved industrial waste disposal site. Puncture or shred and bury empty packaging at a local authority landfill. Empty packaging and unused product should not be burnt. Do not store for prolonged periods in direct sunlight. Do not remove Termifilm from UV-impermeable outer-bag until ready to use. Termifilm should be protected from sunlight as soon as possible following installation to avoid damage.

SAFETY DIRECTIONS:

Do not touch or rub eyes, nose or mouth with hand. Facial skin contact may cause temporary numbness. Wash hands after use.

FIRST AID:

If poisoning occurs, contact a doctor or Poisons Information Centre. Phone Australia 131 126.

DIRECTIONS FOR USE**DO NOT use for remedial treatment of pre-existing termite damage.**

SITUATION	PEST	STATE	RATE	CRITICAL COMMENTS
Domestic, commercial, industrial, and public buildings.	Subterranean termites	All States except TAS	Single sheet thickness is sufficient to form an effective barrier	Termifilm must be installed as a complete and continuous barrier. Any gaps or tears present in the sheet after installation must be repaired as per the General Instructions. For complete under slab sheet installations, installers should select an appropriate width sheet to minimise the number of joints needed to complete the installation. For joining sheets, attaching sheets to surfaces and treatment of penetrations, see General Instructions. For specific details on installation of sheet for full under-slab treatments, perimeter treatments, service penetrations, retaining walls and construction joints, see General Instructions.

NOT TO BE USED FOR ANY PURPOSE, OR IN ANY MANNER, CONTRARY TO THIS LABEL UNLESS AUTHORISED UNDER APPROPRIATE LEGISLATION.

GENERAL INSTRUCTIONS

Termifilm is a professional termite protection and moisture barrier system for new structures and extensions to existing structures. The purpose of Termifilm is to deter concealed entry by subterranean termites from the soil into the structure above the termite barrier as per the Australian Standard Series AS 3660 Termite Management.

Critical Application Details
The installation of Termifilm must be in accordance with Australian Standard AS 3660 recommendations between the structure and any termite colonies in accord with AS 3660. A great deal of care is required to understand the construction details of the building and to install Termifilm in a manner which ensures a complete and continuous barrier.

(A4 100%) 23/08/2011

Termifilm sheets and strips may be cut to size in order to fit different building construction methods and systems.

Termifilm may be installed as a complete under-slab treatment providing both termite and moisture protection or as a flexible termite management system that can be used as part of a complete termite barrier. If Termifilm is used in combination with a concrete slab acting as a physical termite barrier the slab must be poured in accordance with Australian Standard AS 2870 Residential Slabs and Footings.

Prior to Installation

Prior to installing Termifilm it is recommended that a site inspection is performed and the following precautions are carried out.

- Eliminate any active nest of an economically important species of subterranean termite found within the property boundary up to a distance of 50m from the proposed new building work.
- Excavate all tree stumps, logs, and roots and remove from the building footprint.
- Remove all timber off-cuts, building debris, removable framework and materials likely to puncture the film from the area where the Termifilm is to be installed.

Joining Sheets

In most situations Termifilm sheeting is held in place by construction materials as the structure is built. For instance, under-slab installations are held in place by the slab itself exhibiting downward pressure.

In such cases adhesives or bonding agents used to join sheets are required until these construction components are installed.

In situations where construction materials do not exert pressure on sheet overlaps such as perimeter cavities, a permanent bond must be created.

Such a bond can be made by high strength construction adhesive, which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites. High strength construction adhesive, which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites. Appropriate adhesives are those designed by the manufacturer to provide a construction grade bond between two impervious plastic sheets. If unsure of the suitability of the adhesive to be used contact the adhesive manufacturer for technical support. Ensure that a minimum of 200mm overlap is achieved when joining.

Repairing Tears or Gaps

If the blanket is ripped or torn it must be repaired by applying a single strip of sufficient size to fully cover the gap or tear plus a minimum overlap of 200mm. The repair strip is bonded onto the tear/gap as detailed above in joining sheets which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites.

Complete Under-Slab Treatment

Termifilm provides both termite and moisture protection when installed as a complete under-slab treatment. Install the Termifilm on top of the bedding sand prior to laying steel reinforcing mesh. Ensure there is enough overlap at the slab edge to allow full moisture and termite protection. Overlaps on full under-slab applications are to 200mm and should be sealed with good quality duct tape (3M Performance Plus is recommended). Use an appropriate high strength construction adhesive, which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites.

Care should be taken to ensure no holes are made in the sheet when laying the steel mesh. The concrete is then poured on top of the Termifilm Barrier.

Perimeter Treatment**In-fill Slab**

Secure the Termifilm to the outer edge of the brickwork and fold the Termifilm over the top of the brickwork securing it to the internal brickwork towards the footings.

Ensure that prior to the slab being poured that the Termifilm is securely held in place using an appropriate adhesive or bonding agent which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites and designed by the manufacturer to provide a construction grade bond between the Termifilm and the material it is being bonded to. The damp proof course is installed above the Termifilm.

Rebated Slab Edge

Termifilm should be installed before the timber frame has been raised. Attach one edge of the Termifilm to the slab to ensure the frame bottom plate will be placed on top of the Termifilm using an appropriate adhesive or bonding agent which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites. The second edge is fixed to the upper surface of the brickwork with the outside leading edge being visible in the damp proof course (DPC) horizontal mortar joint using an appropriate adhesive or bonding agent which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites and designed by the manufacturer to provide a construction grade bond between the sheet and the material it is being bonded to. Any excess Termifilm sheet is installed into the cavity.

Corners

Corners must be carefully installed ensuring the finished corner is smooth and Termifilm is continuous. Make cuts from the edge of the Termifilm into the corner of the slab to allow folding of the Termifilm around the corner.

At a corner two Termifilm must be joined and sealed using an appropriate adhesive or bonding agent which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites and designed by the manufacturer to provide a construction grade bond between the sheet and the material it is being bonded to with a minimum of 200mm overlap.

Service Penetrations

To protect penetrations construct a Termifilm penetration collar.

Each penetration requires one patch of Termifilm (300mm x 300mm). A cross-slit is cut in the centre of each patch to the exact dimensions of the penetration. This patch is placed around the penetration and secured to the penetration, and the moisture membrane using an appropriate adhesive or bonding agent which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites and designed by the manufacturer to provide a construction grade bond between the Termifilm and the material it is being bonded to. A 40mm wide collar of Termifilm may also be secured around the penetration abutting the patch using an appropriate adhesive or bonding agent which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites and designed by the manufacturer to provide a construction grade bond between the Termifilm and the material it is being bonded to. Two cable ties are used to further secure the seal around the penetration.

LEAFLET PG 2 of 2 -- 244 x 114mm (2 panels with one attached to leaflet front)

Ensure there are no gaps between the moisture membrane, the Termifilm patch and the penetration.

Termite Caps and Strip Shielding
Termite shields are installed on all subfloor structures such as piers, posts, stumps and walls below the underside of the lowest floor framing member or suspended concrete slab, to provide a continuous barrier. Strips of Termifilm are fitted to allow for a minimum overhang of 40mm on all exposed sides in the subfloor region. When joining Termifilm strips they must be sealed using appropriate adhesive or bonding agent which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites and designed by the manufacturer to provide a construction grade bond between the Termifilm and the material it is being bonded to.

Retaining Walls
Termifilm can be used as a termite barrier when installed against a retaining wall. Termifilm does not negate the necessity for installation of conventional water-proofing materials. Termifilm should be installed down to the base of the wall plus 200mm across the footing, in order to cover the base course mortar joint, and is then secured to the external concrete/brickwork. All joints and edges must be sealed using appropriate adhesive or bonding agent which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites and designed by the manufacturer to provide a construction grade bond between the Termifilm and the material it is being bonded to.

Construction Joints
Install a minimum of 300mm wide strip of Termifilm immediately under the construction joint by adhering it to the moisture membrane.

If Termifilm is being used in a continuous manner as the moisture membrane, there is no need for installing an additional strip under the construction joint.

The Termifilm strip must be located central to the construction joint.

For Existing Masonry/Concrete To New Concrete Joints
- Including Additions, Paths, etc.

Fix one edge of the Termifilm to the existing vertical edge surface using an appropriate adhesive or bonding agent which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites and designed by the manufacturer to provide a construction grade bond between the Termifilm and the material it is being bonded to. The Termifilm must start within 20mm of the upper edge of the new concrete. Adhere all joints and ensure that the Termifilm remains continuous towards the footing and for at least 150mm horizontally under the new concrete. It must be adhered to the upper surface of the moisture membrane using an appropriate adhesive or bonding agent which has been documented to demonstrate meeting Australian Standard 3660 - Termite Management with respect to providing a barrier to subterranean termites and designed by the manufacturer to provide a construction grade bond between the Termifilm and the material it is being bonded to.

Note: Also view Termifilm installation manual for further information on this installation methods mentioned on this label

Service Requirements:
Regular competent inspections are strongly recommended as part of an ongoing termite management program. Service requirements should be determined as a result of at least an annual inspection by a licensed professional pest manager.

More frequent inspections may be required in high-risk termite areas in determining the need for service, factors such as local termite pressure, breaches of the barrier and termicide longevity should be considered.

To minimise the risk of termite infestation, the subfloor area of buildings should be kept free of stored or waste timber and all other building materials that attract termites.

Appropriate action should also be taken to eliminate any undue dampness caused by leaking water or sewerage pipes, or inadequate drainage. Termifilm will provide up to five years protection.

INSECTICIDE RESISTANCE WARNING

GROUP 3A INSECTICIDE

For insecticide resistance management Manufacturing Concentrate is a Group 3A insecticide.

Some naturally occurring insect biotypes resistant to Permethrin and other Group 3A insecticides may exist through normal genetic variability in any insect population. The resistant individuals can eventually dominate the insect population if Permethrin or other Group 3A insecticides are used repeatedly. The effectiveness of Permethrin on resistant individuals could be significantly reduced. Since occurrence of resistant individuals is difficult to detect prior to use, The Bugshop or Berkem Pty Ltd accepts no liability for any losses that may result from the failure of Permethrin to control resistant insects.

Permethrin may be subject to specific resistance management strategies.

For further information contact your local supplier, The Bugshop or Berkem Pty Ltd representative or local agricultural department agronomist.

PROTECTION OF WILDLIFE, FISH, CRUSTACEANS AND ENVIRONMENT:
Dangerous to fish. Do not contaminate streams, rivers or waterways with the product or the used container.

STORAGE AND DISPOSAL:

Store in the original packaging in a cool well-ventilated area. Do not store for prolonged periods in direct sunlight. Dispose of unused off-cuts by laying over the Termifilm barrier at an installation site and cover with concrete slab or place in cavity wall. If this is not possible, off-cuts should be placed in a sealed plastic bag and disposed of via an approved industrial waste disposal site. Break, crush or puncture empty packaging and deliver to an approved waste management facility. If an approved waste management facility is not available, bury the empty packaging 500mm below the surface in a disposal pit specifically marked and set up for this purpose clear of waterways, desirable vegetation and tree roots, in compliance with relevant Local, State or Territory government regulations.

SAFETY DIRECTIONS:

Wash hands after use.

FIRST AID:

If poisoning occurs, contact a doctor or Poisons Information Centre, Phone Australia 131126.

MSDS:

Additional information is listed in the Material Safety Data Sheet.

NOTICE:

Conditions of Use
